

Rapid Recovery Service

Clean.
Disinfect.
Deodourise.

Destroy microbes and pollutants quickly and efficiently.

The importance of clean air cannot be overstated, especially during a pandemic. If you are preparing your building for tenant or employee reentry, reopening your business, performing scheduled maintenance or cleaning after a suspected positive case of infection, our Rapid Recovery indoor air quality treatment is a necessity. Use this service to quickly destroy mould, microbes and gases that can pollute your indoor air and cause illness.

Our service uses a Rapid Recovery Unit® (RRU) made by RGF Environmental Group, Inc. RGF has been at the forefront of air, food and water purification since 1985. Major corporations and entities around the globe use its technology to ensure healthy air quality.

HOW IT WORKS

The Rapid Recovery Unit® (RRU) uses RGF's proprietary Photohydroionisation® (PHI) technology. Light energy from the ultraviolet (UV) cell reacts with the air and a hydrated quad-metallic catalyst to create cleansing ions. These ions, such as hydro-peroxides and super oxide ions, go from the system into the surrounding air to destroy microbes, mould and gases. Rapid Recovery has been thoroughly tested on airbourne and surface bacteria and viruses, including MRSA, E-Coli, Norwalk and SARS-CoV-2. It also suppresses microbe growth, reduces chemicals and eliminates odours. The odour absorbing media filter cartridge enhances the speed and efficacy of the system by filtering out gross particulate, such as smoke, while the advanced oxidisers treat the air in the space.

SAFE FOR YOU, DEADLY FOR GERMS

PHI technology creates an advanced oxidation reaction that eliminates odours, viruses, bacteria and mould. The reaction is safe for people, pets and the environment; it creates "friendly oxidisers" that return to oxygen and hydrogen after destroying pathogens and leaves no residual chemicals. PHI technology has even been approved by the USDA-FDA-FSIS for food processing.

Indoor air quality

SAFE FOR YOU, DEADLY FOR GERMS

Photohydroionisation® (PHI) technology creates an advanced oxidation reaction that eliminates odours, viruses, bacteria and mould. The reaction is safe for people, pets and the environment; it creates “friendly oxidisers” that return to oxygen and hydrogen after destroying pathogens and leaves no residual chemicals. PHI technology has even been approved by the USDA-FDA-FSIS for food processing. Hydro-peroxides are naturally occurring oxidisers that are created in our atmosphere with the combination of oxygen molecules, water vapour and electromagnetic energy. Ionised hydro-peroxides effectively destroy harmful microbes in the air and on surfaces by cell lysis. This process changes the microbes’ molecular structure, rendering them harmless, and occurs constantly in outdoor air. RGF’s PHI technology allows this natural process to happen within air conditioned spaces safely.

NOTICE THE DIFFERENCE

Our clients point out the remarkable difference in smell after using our Rapid Recovery service. Free from contaminants, your building is left with clean air. Rapid Recovery destroys odours from tobacco, diaper pails, chemical fumes, cleaning chemicals, cooking, mould, mildew, paint, pets, sewage, decaying organic matter and volatile organic compounds.

Call AIRCARE today to find out more about how our RGF indoor air quality products can work for your school:
